

# **ELECTRICAL DOCUMENTATION**

**Model : SUPER JOBBER *Elite* / 500 / XL / LM CNC**

**Control System : Fanuc Oi - TF**

**Super Jobber Elite / 500 / XL / LM\_2016\_00**

**SUPER JOBBER Elite / 500 / XL / LM CNC is supplied with the following features:**

- 1) Fanuc 0i -TF CNC system
- 2) Fanuc  $\beta 8$  / 8000i Spindle motor
- 3) Fanuc  $\beta 8$  /3000 is Axes motors
- 4) Manual pulse generator
- 5) BTP-80, Bi-Directional, Electromechanical 8 station turret
- 6) Hydraulic Tailstock with Programmable Quill
- 7) Drain line oil cooler
- 8) Rapid rate 20 / 30 m/min
- 9) Spindle orientation
- 10) Rigid tapping
- 11) Three Colour M/C Status Lamp
- 12) Door interlock, Mechanical
- 13) Coolant System, RKM 120
- 14) Built-in Lighting system
- 15) AC unit for control cabinet, Panel Cooler

We are herewith furnishing electrical circuit drawings taking all options into account. Hence CUSTOMERS/MMT service engineers are requested to refer only those options which are supplied along with the machine.

NOTE: - Should you come across any discrepancies in this manual please let us know.

We have given M - code for Chuck ID/OD selection instead of selector switches.

(Refer M - code list)

Page | 1 of 1

**Note on MATD-08/MATF-01 logic (effective from 01-10-2015)**

- 1) No password required to view ladder
- 2) Alarm : 1095 ABS ENCODER NOT SET(P1815.5)  
Cause: P1815#5 is set to 0  
Remedy: Set P1815#5 to 1. Absolute position detector (absolute pulse coder)
- 3) Chuck clamp/declamp operation:  
Earlier logic: The chuck used to clamp/declamp by foot switch only after the completion of the earlier initiated action.  
Current logic: The chuck can be clamped/declamped by foot switch even if the earlier initiated action is not completed.
- 4) Turret feedback: The input addresses X0002.6 and X0002.7 are free for use.
- 5) Lifting function against gravity at emergency stop and power failure  
Direction of lifting can be defined M-codes and lifting distance to be entered in respective parameter.

M101	+X LIFT ENB M-CODE	P2373 = 0 to 500 $\mu$ m
M102	-X LIFT ENB M-CODE	P2173 = 0 to 500 $\mu$ m
M103	+Z LIFT ENB M-CODE	P2373 = 0 to 500 $\mu$ m
M104	-Z LIFT ENB M-CODE	P2173 = 0 to 500 $\mu$ m
- 6) Message: 2116 PRESS MACHINE RESET PB,  
After releasing emergency, press machine reset push button to switch on hydraulics
- 7) Door lock solenoid  
In jog mode door lock solenoid is activated by Spindle clockwise or counter clock push button and Spindle stop push button in jog mode. In Auto or MDI mode door solenoid is activated by cycle start signal and it can be deactivated only not in cycle running by pressing Door open/close pushbutton or executing M46 OR M30.
- 8) M02 code can be used for part count and restart the part program.
- 9) Power-on lubrication: Lubrication occurs only if the elapsed time is more than 30min since last lubrication

- 10) During M01/M00, amber lamp is on, to indicate machine in idle state.
- 11) Programmable periodic maintenance alarms are available and can be programmed according to customer's needs.
- 12) Combined M-codes are available for the following operations:
- M48 Auto door open +T.S. Quill return
  - M49 Auto door close + T.S Quill forward
  - M48 Auto door open + Chuck Open (K8.0=1)
  - M49 Auto door + Chuck Close (K8.0=1)
  - M48 Auto door +T.S Quill Return + Chuck Open (K8.1 =1)
- 13) When door interlock is enabled, door has to be opened and closed at least once before every cycle start in auto continuous mode
- 14) When two hand cycle start is used, both cycle start push buttons have to be pressed within 0.5 sec duration; otherwise cycle will not start.

### **Revised 0ITD-06/MATD-07 logic (effective from 06-08-2012)**

- **Turret unclamp override:** Whenever turret is unclamped to move axis in manual mode press Lube-1 inch push button and Jog Keys or Manual Pulse Generator.

### **(Effective from 02-04-2012)**

- Machine Control Panel (MCP) and Operator Control Panel (OCP) are integrated as single Machine Operator Panel (MOP).
- Gray code rotary switches are used for Mode Selector, Feed override, Rapid override and Spindle speed override.
- Rapid override and MPG/Step feed functions are controlled in single rotary switch. In handle mode MPG/Step feed is controlled and in other mode Rapid feed is controlled.
- Program check and Machine lock are integrated as Program test.
- Turret index, Door Open/Close and Lub. inch switches keep pressing 500ms to actuate.
- T.S body actuation delay (2000ms) to Forward and Retract
- Alarm "TURRET UNCLAMPED, MOVE SAFE ZONE INDEX" occurs, move axis to safe zone in manual mode and Turret index
- Alarm" MOVE T.S. QUILL TO HOME POS." occurs if T.S Quill moves beyond forward proximity, Move T.S. Quill to home position.

### **Revised 0ITD-05/MATD-05 logic (effective from 26-05-2011)**

- **3-tier tower lamp:** Machine state is indicated with green/amber/red color as given below:  
*GREEN:* Cycle running in auto/MDI (glows continuously)  
*AMBER:* Operator's message (glows continuously) and end of the cycle (blinks at 1 Hz)  
*RED:* CNC/PLC alarm (glows continuously)
- **Chip Conveyor:** After selecting auto mode, chip conveyor starts running after 5 sec. delay (fixed timer).
- **Chuck function completion:** A delay (timer no.40) can be introduced between chuck clamp/declamp pressure sw. actuation and M10/M11 finish to make sure physical movement of chuck jaws is complete.
- **Hyd. counter balance pressure monitoring (VTL series):** Z-axis counter balance pressure is monitored using pressure switch (S258).

## **Modification On 0iTD-04/MATD-05/MATD-06 logic version**

### **➤ PMC TYPE**

- Programming tool is updated to Fanuc Ladder-III Version- 5.8
- PMC type changed to *0I-D PMC* for 0i-TD control system
- PMC type changed to *0I-D PMC/L* for 0i MATE -TD control system

### **➤ Lubrication operation**

- Lubrication healthy conditions -ESP signal high, no low Lube oil level and No lub fault
- Automatic lubrication is initiated with POWER ON and not after every emergency release
- Automatic lubrication is initiated after every 25.6 minutes (Timer no 1= 1536000), If Lube inch Push button is pressed timer resets.
- If timer reaches preset value during Emergency condition, after emergency release lubrication is initiated.

### **➤ Spindle**

When emergency PB is pressed, PSM contactor (K10) goes off only when the spindle stops or the preset time (TMRB50) is elapsed.

### **➤ Machine idle trip**

- If any control switches on OCP/ MCP and foot switches are not operated or cycle is not running for more than 10 Minutes machine idle trip is applied. Machine goes in emergency mode, all auxiliary motors are off for power saving (Timer no 8 = 600000)
- This option is enabled by Default.  
K6.5=1 Enable  
K6.5=0 Disable

### **➤ Turret**

- 1) When turret is indexed by T-code, in addition to comparing turret encoder feedback, the no. of stations through which the turret passes are also counted to avoid wrong tool selection.
- 2) After turret is indexed by T-code, the turret feedback is continuously monitored against the last T-code to detect turret encoder signal malfunctioning.

## 1. Homing logic modifications

### Butt type homing

The Beta-is servomotors are fitted with absolute pulse coders with battery back up. During the first time commissioning or when the servo motor/coupling/belt is disturbed for maintenance or repair, then the home position needs to be re established. Refer the procedure mentioned below

- Switch ON the CNC system
- Release emergency push button
- **Command M-code M40. Alternatively make keep relay K9.7 – 1**
- Now CNC system displays an alarm “000 Please turn OFF power”
- Switch OFF CNC & then switch ON
- Release emergency push button
- Now CNC system displays an alarm APC alarm “X axis need ZRN” & “Z axis need ZRN”
- Select ZRN mode & then press cycle start push button on MCP
- Now one of the axis (Depending upon K0.2) starts moving towards the dead stop at controlled feed rate & controlled torque to hit the dead stop & establishes the reference point. At the end of homing, the corresponding LED comes ON.
- After wards the other axis performs the Butt type homing. The end of butt type homing can be seen by the X & Z reference LED's & also by the arrow marks on the slide.
- Now CNC system once again displays an alarm “000 Please turn OFF power”
- Switch OFF CNC system & switch ON.
- Now the CNC is ready for operation.

Following are the salient features of homing

- During the day to day operations, the CNC can be made ON & the operations can be done with out homing.
- When the motor/coupling/belt is disturbed, it is mandatory to command M40, which prompts for Butt type referencing.
- If homing is done during normal conditions, homing takes place at 20m/min feed rate
- If it is required to home the axis every time when the CNC is ON, then make the keep relay K4.1 – 1. With this it is not possible to run the cycle with out homing.

**Note: - However this type of homing will not take care of the disturbed slide position & commanding M40 or making K9.7- 1 is a must in such events.**

- In the event of clutch trip condition, the keep relay K9.7 automatically becomes 1 & butt type referencing is a must once the clutch is engaged. The procedure for engaging the clutch is listed in the subsequent topics.
- Stroke check is effective always
- When ever the program control switches (Program check, Machine lock or Block delete) switches are operated, then the CNC displays an alarm “Program control switch operated, reset & home”. To clear this alarm, normal homing is must.

2. It is possible to set the number of parts to be machined in the setting screen so that the system displays an alarm “Number of parts machined = Number of parts set” once the machined number of parts exceeds the set value.
3. The spindle M-codes will be finished with out waiting for spindle speed arrival/stop signal. The spindle speed is monitored continuously during feed mode.

#### 4. Clutch logic

- In the event of clutch trip, following events take place
  - Corresponding clutch trip proximity switch comes ON
  - Corresponding axis servo goes OFF
  - Axes brakes to apply (When in Auto/MDI mode)
  - Reference of both X & Z axes goes OFF if they were ON
  - Correspondingly, Axes tripped alarm shall be displayed on the CRT
  - Feed hold will be created
  - CNC displays the alarm "000 Please turn OFF power"
- Find & eliminate the cause for clutch trip
- Select MDI mode & set the stroke limit of the tripped axes to 9999999 (P1320 for X & P1321 for Z axis)
- Select jog mode. Now the brakes of the built in motors will be released. The additional brake of the inclined axis (If any) remains applied.
- Jog the axis to safe zone for clutch engagement
- Press cycle start push button on the MCP to initiate the clutch engagement
- As long as the clutch engagement is in progress, the cycle start LED on the MCP remains ON.
- If both the clutches are tripped, then the X-axis engages first & then the Z-axis.
- When the cycle start LED goes OFF indicating the clutch completion of clutch engagement, switch OFF the machine to clear the "000 Turn OFF power" alarm
- The next CNC ON displays the alarm to initiate the Butt type reference. Refer point 1.
- After Butt type referencing is complete, select MDI mode & set the stroke limit to earlier value.
- Switch OFF CNC & then switch ON & continue the operation after ensuring the arrow marker on both the slides.

**Note: - For proper functioning of the above function, the setting of the clutch trip proximity should not be disturbed**

5. Turret safe zone is established through software
6. Program reset with the mode changeover from EDIT to AUTO continuous.  
After editing any program, when the mode is changed from EDIT mode to AUTO continuous mode, the program automatically gets reset. If there is a need to run the program in AUTO continuous mode from any other program blocks, it is required give one M-code (M62) in MDI mode.  
Note: - If this safety feature is not at all required, then make the keep relay K3.0 – 1
7. If constant surface speed G96 command (CSS) is not cancelled before tool changeover, an alarm "Cancel CSS before T command" will be displayed. It is provided to limit the abuse of the G96 command, which affects the duty cycle requirement of the spindle.
8. Foot switch working under optional stop  
Generally the foot switch for chuck & T.S. quill works during the optional stop condition. If this feature is not required, then make the keep relay K3.2 – 1.
9. Energy saving feature & spindle speed / feed override clamping to 100% is introduced as optional feature
10. To prevent the slide lifting, PLC logic is modified so as to avoid auto lubrication when the auto cycle is ON. The auto lubrication comes ON only at the end of auto cycle. If the auto cycle continues beyond 10 minutes after the lubrication interval is over, then the lubrication comes ON even when the auto cycle is in progress.  
If the machine is with bar feeder, then the auto lubrication triggers when the chuck is de-clamped for component loading.  
If the lubrication fault lamp comes ON when the auto cycle is in progress, the alarms related to lubrication comes ON only when the auto cycle is stopped. If the auto cycle continues beyond 10 minutes with out stopping, then the alarm displays & stops the auto cycle.

**Machine Model : SUPER JOBBER ELITE / 500 / XL / LM CNC LATHE**
